EXECUTIVE SUMMARY

01

Denmark | Summary

Market attractiveness

Denmark has a long-standing commitment to sustainable development, which has led to the country becoming a **global leader in renewable energy**. This provides a supportive regulatory environment and access to extensive knowledge and expertise in the green energy sector. The country has a high rank of 4 out of 175 in ease of doing business and a gross value added (GVA) by sector of 14% in energy and utilities. Denmark has a reliable supply of electricity, strong logistics performance, and a low corruption index score. Furthermore, Denmark's trade conditions, labour supply and political and legal stability make it an excellent destination for investments in or reliant on green energy infrastructure.

Regulatory landscape

Denmark's green energy transition has been accelerated in response to the importance of energy independence in the EU due to Russia's invasion of Ukraine. **The Danish government has set ambitious targets for renewable energy production**, which are supported by a 7.2 bn. EUR green investment fund. These initiatives, combined with Denmark's political stability, low corruption and transparent legal system, make the country an attractive destination for investors.

The Danish economy is AAA-rated making it a safe and stable place to invest. Additionally, Denmark's commitment to reduce CO₂ emissions reinforces its position as a leader in the green energy transition.

Labour market

Denmark has a highly skilled workforce, including engineers, researchers and other professionals with expertise in the green energy sector. Currently, there is a shortage of highly skilled labour in the private sector. Varde municipality proactively works with a recruitment program to attract foreign workers. The country has a strong tradition of unionisation, with 67% of employees in unions. Employment contracts and termination notice periods vary by length of service, but generally, there is a 3-month notice period for termination. Workers enjoy a standard 37-hour workweek and 25 days of holiday per year. Hiring foreign workers is possible but easier for EU/EEA/Switzerland citizens.

Infrastructure & utilities

Denmark has a **well-developed infrastructure** with reliable highways, railways, industrial ports and international airports, all connected with different transportation modes. Likewise, Denmark has a developed utility network. The power grid is highly reliable and efficient, mostly powered by renewable energy sources. Furthermore, Denmark is part of a European hydrogen network connecting and developing new hydrogen pipelines across Europe. The hydrogen network is expected to cover most of Denmark, and it will be connected to Norway, Sweden and Germany, providing excellent opportunities for the transportation of hydrogen. Denmark is further deeply committed to promoting sustainable practices in the energy sector through large investments.

Overview

EU Membership	Yes
NATO Membership	Yes
Real GDP 2022	402 b USD

Ease of Doing Business (2019)	No. 4 of 175 countries
# of top-ranked engineering universities in top 250	4

Varde | Summary

Climate ambition

- Varde's ambition aligns with the Paris Agreement, focusing on reducing global greenhouse gas emissions and limiting the temperature increase to 1.5°C.
- Varde aims to **reduce greenhouse gas emissions by 70% by 2030** and to be completely climate-neutral by 2050.
- Varde prioritises renewable energy production, particularly solar, wind and biogas, alongside improving energy efficiency and infrastructure while enhancing green fuel infrastructure for reduced transport-related CO2 emissions.

Utilities

- Varde collaborates with Energinet to establish a resilient power grid, with new transformer stations ensuring a reliable energy supply in the green energy sector.
- **The planned hydrogen backbone and existing biogas entities make it an attractive destination for Power-to-X facilities**, enabling large-scale production of green hydrogen.
- Varde's strategic location as a landing hub for subsea connections, combined with its cool climate and extensive fibre grid, positions it as an ideal destination for data centres and battery factories.

Climate action plan

- Varde's energy sector plan involves **phasing out all oil and gas boilers by 2030 and transitioning to sustainable heat sources**, supporting fossil fuel-free district heating, and expanding renewable energy sources through solar panels, windmills, and attracting PtX and data centres to recover and utilise surplus heat.
- Varde aims to promote sustainable business growth through dialogues with companies in Green Network Varde.
- Varde aims to develop several Carbon capture and storage projects from waste incineration in collaboration with Energnist.

Infrastructure

- Varde's excellent highway infrastructure connects it to major cities like Copenhagen and Hamburg (3 hours), facilitating easy access to a mobile labour force and attracting qualified workers.
- The well-developed railway network in Varde, connected to the Port of Esbjerg, makes the municipality an attractive destination for companies aligning with the EU's TEN-T strategy.
- The Port of Esbjerg is responsible **for shipping 80% of Europe's offshore wind capacity**, why it offers robust import and export capabilities.
- With Billund airport just 40 minutes away there is convenient access to the rest of the world.

Green energy hub

- Varde's strategic location in the North Sea offers immense potential for investments in the renewable energy sector.
- The Esbjerg/Varde business region has become a thriving hub for the offshore wind industry, with ambitious goals of installing 260 GW of offshore wind power by 2050, creating significant investment opportunities in offshore wind farms.
- Esbjerg/Varde's successful transition from the fossil fuel industry to the wind power sector positions it as an attractive location for sustainable investments, aligned with the growing demand for renewable energy sources.
- The region's appeal extends to the data centre industry, with renewable-powered data centres and low electricity prices. The cold climate enables cost-effective data storage and processing while leveraging outside air for cooling.
- The rising demand for energy storage solutions, such as power-to-x facilities and battery factories, presents favourable investment opportunities.
- Plans for "energy islands" and carbon capture utilisation and storage (CCUS) projects emphasise the region's commitment to fast-track the green energy transition causing an attractive investment potential.

Sector coupling | Summary

Description and synergies of energy-intensive industries

Description

Synergies

Power-to-X

PtX technology can convert water into green hydrogen through electrolysis via renewable energy. The green hydrogen can either be used directly or synthesised into different forms (x).

PtX offers synergies across industries by providing surplus heat to the district heating network. PtX can further fertilise the agricultural sector and produce E-fuels to decarbonise transportation.

Data Centre

A data centre serves as a space for essential IT infrastructure, enabling the creation, operation and delivery of applications and services. It also handles data storage and management.

Data centres offer surplus heat to the district heating network or process heat to various industries. Data centres add renewable energy to the energy mix through PPAs.

CO₂ Industries

CO₂-heavy industries can take various forms depending on the CO₂ origin. Green CO₂ originates from point sources burning biomass Black CO₂ originates from point sources burning fossil fuels.

There are strong synergies between CO₂-heavy industries and PtX facilities. PtX is dependent on CO₂ as input in order to store and form the green hydrogen into different E-fuels or gasses. There are also excellent CCS possibilities due to the Bifrost project.

Battery Factories

A battery factory is a manufacturing facility that produces rechargeable lithium-ion batteries, primarily for electric vehicles. Additionally, the batteries can be used for portable electronics and renewable energy storage systems.

Battery factories generate renewable surplus heat, if they are powered by green electricity. Battery factories can also utilise surplus heat and regenerate water back to other resources.

Greenhouse

Greenhouse farming cultivates crops in controlled structures, allowing farmers to regulate temperature, humidity and sunlight. It can produce various products like vegetables, fruits, plants and flowers.

Greenhouses provide an excellent solution for utilising the surplus heat generated by energy-intensive industries. Moreover, PtX facilities and greenhouses have synergistic benefits, as the ammonia produced by PtX can be used as fertiliser.

Symbiotic effects

Symbiotic effects have been considered when selecting site locations

Red = Heat | Blue = Cooling | Yellow = CO₂ and gas | Green = Electricity

Overview of 22 ha Greenhouse, Lindbjergvej 1

Site summary

Utilities:

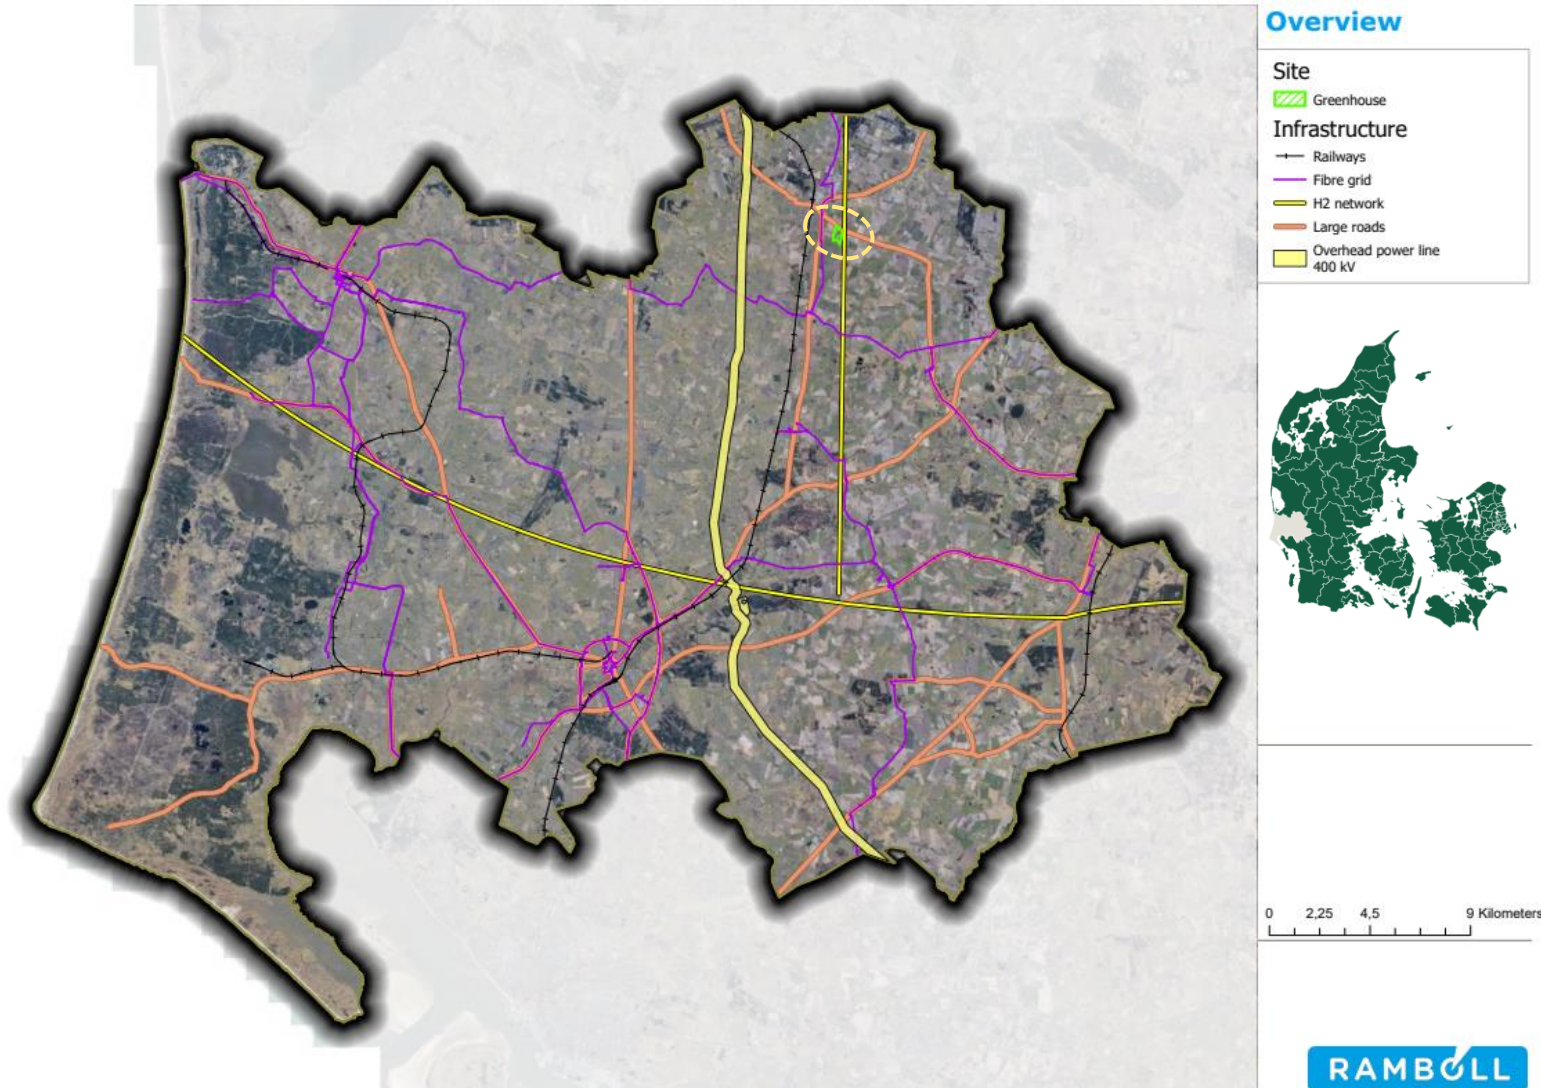

The site's strategic location near a co-location data centre presents an advantageous opportunity for harnessing surplus heat. By being an off-taker of this heat, the chosen site exemplifies the concept of sector coupling. The greenhouse facility can efficiently utilise renewable surplus heat at an affordable price while also extending support to other industries seeking to discard their surplus heat. The surrounding area provides an excellent utility network, but it will not be possible to connect to the collective electrical grid before 2027.

Protected areas:

Greenhouses possess a non-disruptive nature, enabling their placement near protected areas. This presents an opportunity for constructing a large-scale greenhouse that coexists harmoniously with the protected areas. The chosen site does not overlap with any protective areas, why it should be easy to obtain the needed permits. A minor attention point is a preserved historic site in the western part of the site, which will require an additional cost to build on top of.

Land ownership and suburban areas:

The identified site is owned by seven different landowners, featuring three properties. And the site benefits from excellent transport facilities with a large road right next to the site.

Denmark | Macroeconomic factors

Inflation

- Due to the volatile energy prices and war in Ukraine the inflation rate reached unprecedented highs in 2022 of 7.7%.
- The pace of the inflation rate is expected to decrease toward 2025 and reach a level close to the yearly target of 2%.

Unemployment

- Denmark's unemployment has been decreasing over the past few years to record low level of 4.5%.
- Although high inflation may bring some uncertainty to the labour market, Denmark's economy is starting from a strong position and the consistent decrease in unemployment rates is a positive indicator for the future.

Interest rate

- Succeeding years of negative interest, the interest rate has increased significantly to 2.75%.
- This is due to the contractionary monetary policy from the European Central Bank trying to slow down the inflation.
- It is our hypothesis the interest rate will decrease as the inflation rate approaches the yearly target of 2%.

Education

- Denmark's highly educated workforce includes 28.3% with vocational education degrees, 16.1% with medium-term higher education degrees and 11.6% with Master degrees.
- The country's focus on education and research is reflected in its low unemployment rate. Investors can safely rely on Denmark's skilled labour force to support their business ventures.

Share of educated population (Highest completed education)

Denmark | Overall assessment of market attractiveness

Assessment

Denmark is a **highly attractive country for investing in green energy infrastructure, such as PtX facilities, Battery factories, Data centres and greenhouses**. The country has a high rank of 4 out of 175 in ease of doing business, a GVA by sector of 14% in energy and utilities, and a high ranking in enforcing contracts. Denmark's labour productivity is also high at \$66/h, and the unemployment rate is low at 4.5%. The country has a reliable supply of electricity, strong logistics performance, and a low corruption index score. Denmark's market attractiveness, trade conditions, labour supply and political and legal stability make it an excellent destination for green energy infrastructure investment.

Overall assessment	High
Market attractiveness	High
Labour supply	High
Trade conditions	High
Political and legal stability	High

Labour supply	High
Labour productivity (2021)	\$66/h
Human capital index (2020)	22/173
English Skills Index	5/111
Unemployment rate	4.5%

Market attractiveness	High
Ease of doing business	4/190
GVA ¹ by sector (energy & utilities)	14%
Inward FDI stock per capita	\$26.5k
FDI inward stock	\$142.7b
Corporate tax rate	22%
Electricity price c€/February 2023	€30.3c

Trade conditions	High
Dealing with construction permits	High
Trading across borders	High
Reliability of electricity supply	High

Political and legal stability	High
Enforcing contracts rank	14/189
Corruption index score rank	1/180
Political environment (political stability & government effectiveness)	32/194

Denmark | Labour market

Labour market landscape

- There is a current shortage in the Danish labour market with record high employment rates.
- The shortage is particularly evident in the private sector for highly skilled labour, such as engineers and IT specialists. Varde municipality proactively addresses this issue with a recruitment program to attract foreign workers.
- The high inflation caused by volatile energy prices and the war in Ukraine is bringing uncertainty to the Danish labour market, but Denmark has a robust starting point with a stable economy and low unemployment rate.

Hiring and Termination

- An employment contract must state the parties, the type of work, the place of work and the work, and pay conditions with the remuneration components.
- Termination - notice period varies depending on the type of employment and length of service.
 - 0-6 months: 1 month
 - 6-36 months: 3 months
 - 36+ months of service: 5-6 months
- When terminating, the employer must state a reason which needs to be clear for the employee to understand why they are terminated.

Labour mobility

- The amount of people who commute more than 100 km daily has increased 64% since 2002.
- The average commute to and back from work combined was in 2019 44 km.
- 67% commutes by car.
- In 2019 258,200 people commuted more than 100 km a day representing 9.4% of the Danish labour market.

Contributions and entitlements

- In Denmark, pay and working conditions are typically laid down by collective agreements concluded between trade unions and employers' organisations. This system of labour market regulation is referred to as the Danish Model.
- As a general rule in Denmark, working hours are fixed in a collective agreement, and in the great majority of sectors, standard working hours are 37 hours.
- According to the Danish holiday rules, a worker is entitled to 25 days' holiday a year.

Union participation

- Denmark has a high proportion of employees in unions of 67%.
- The trade unions have a collective bargaining coverage of 80%.
- There is a decreasing number of union members.
- The country's strong tradition of collective bargaining and social dialogue has played a significant role in fostering this culture of unionisation.

Hiring foreign workers

- EU/EEA/Switzerland citizens and their relatives have the same rights as Danish citizens and do not need a work permit.
- Other foreigners can be hired if they have permission to work and a residence permit.
- Foreigners must apply for this permission before starting to work in Denmark.
- Specialised workers with long education can be hired through a fast track.
- It is difficult to hire non-EU workers if they are not specialised.

Denmark | Regulatory landscape

Political & Economic Environment

#1 CORRUPTION PERCEPTION INDEX

Denmark's political stability, low corruption and transparent legal system make it an attractive destination for foreign investors looking to invest in green energy projects.

THE DANISH ECONOMY IS AAA-RATED

Denmark has a high economic prosperity and is AAA-rated, which make a safe and stable place to invest.

THE DANISH KRONE IS PEGGED TO THE EURO

Denmark has successfully pursued a fixed exchange rate policy since 1982 and DKK is pegged to the Euro since 1999. 1 EUR = 7.46 DKK.

CORPORATE TAX RATE OF 22%

The Danish corporate tax rate of 22% is slightly above EU average of 18.5%.

CLIMATE LAW WILL REDUCE CO2 EMISSIONS by 70% in 2030

In 2019, Denmark adopted a new climate law committing to reduce CO2 emissions by 70% in 2030 compared to the 1990 emission level.

Denmark commits to renewable energy

- Russia's invasion of Ukraine has increased the importance of energy independence for the EU, leading Denmark to accelerate its green energy transition.
- The Danish government has launched initiatives to reduce reliance on fossil fuels and increase renewable energy production.
- A 7.2 bn. EUR new green investment fund will support the development of green energy infrastructure.
- Denmark has set ambitious goals to quadruple solar and land wind energy production and increase offshore wind power fivefold by 2030.
- The government plans to phase out gas heating in households and make all gas in the country green by 2030.
- These initiatives position Denmark as a global leader in the transition to sustainable energy, with a focus on reducing emissions and achieving energy independence.

"With these agreements, Denmark will become a green power hub for Europe, with an enormous expansion of our renewable energy sector."

Dan Jørgensen - Minister of Climate, Energy and Utilities

Green Energy Outlook

Green energy market forecast (GW)

Infrastructure

Highways

- The Danish highway infrastructure is generally well-maintained and reliable, with a high level of stability and safety.
- The highway network is integrated with other modes of transportation, such as rail and sea transport, to provide efficient and environmentally friendly logistics solutions.

Railways

- The Danish railway network is well-integrated with other modes of transportation, including sea and road transport.
- Denmark is committed to increase railway transport of industrial goods to implement the EU green deal and revised TEN-T strategy.

Industrial ports

- Denmark has a long history as a maritime nation and a well-developed network of industrial ports that serves many industries and accelerates the green energy transition.
- The country's strategic location on the North Sea makes it an important hub for green energy development and transportation.

International airports

- Denmark has a well-developed network of international airport infrastructure across the nation that is well connected to other modes of transport.
- The aviation industry has ambitious targets to reduce CO₂ emissions, why Denmark is investing to promote sustainable aviation fuels.

Utilities

Hydrogen network

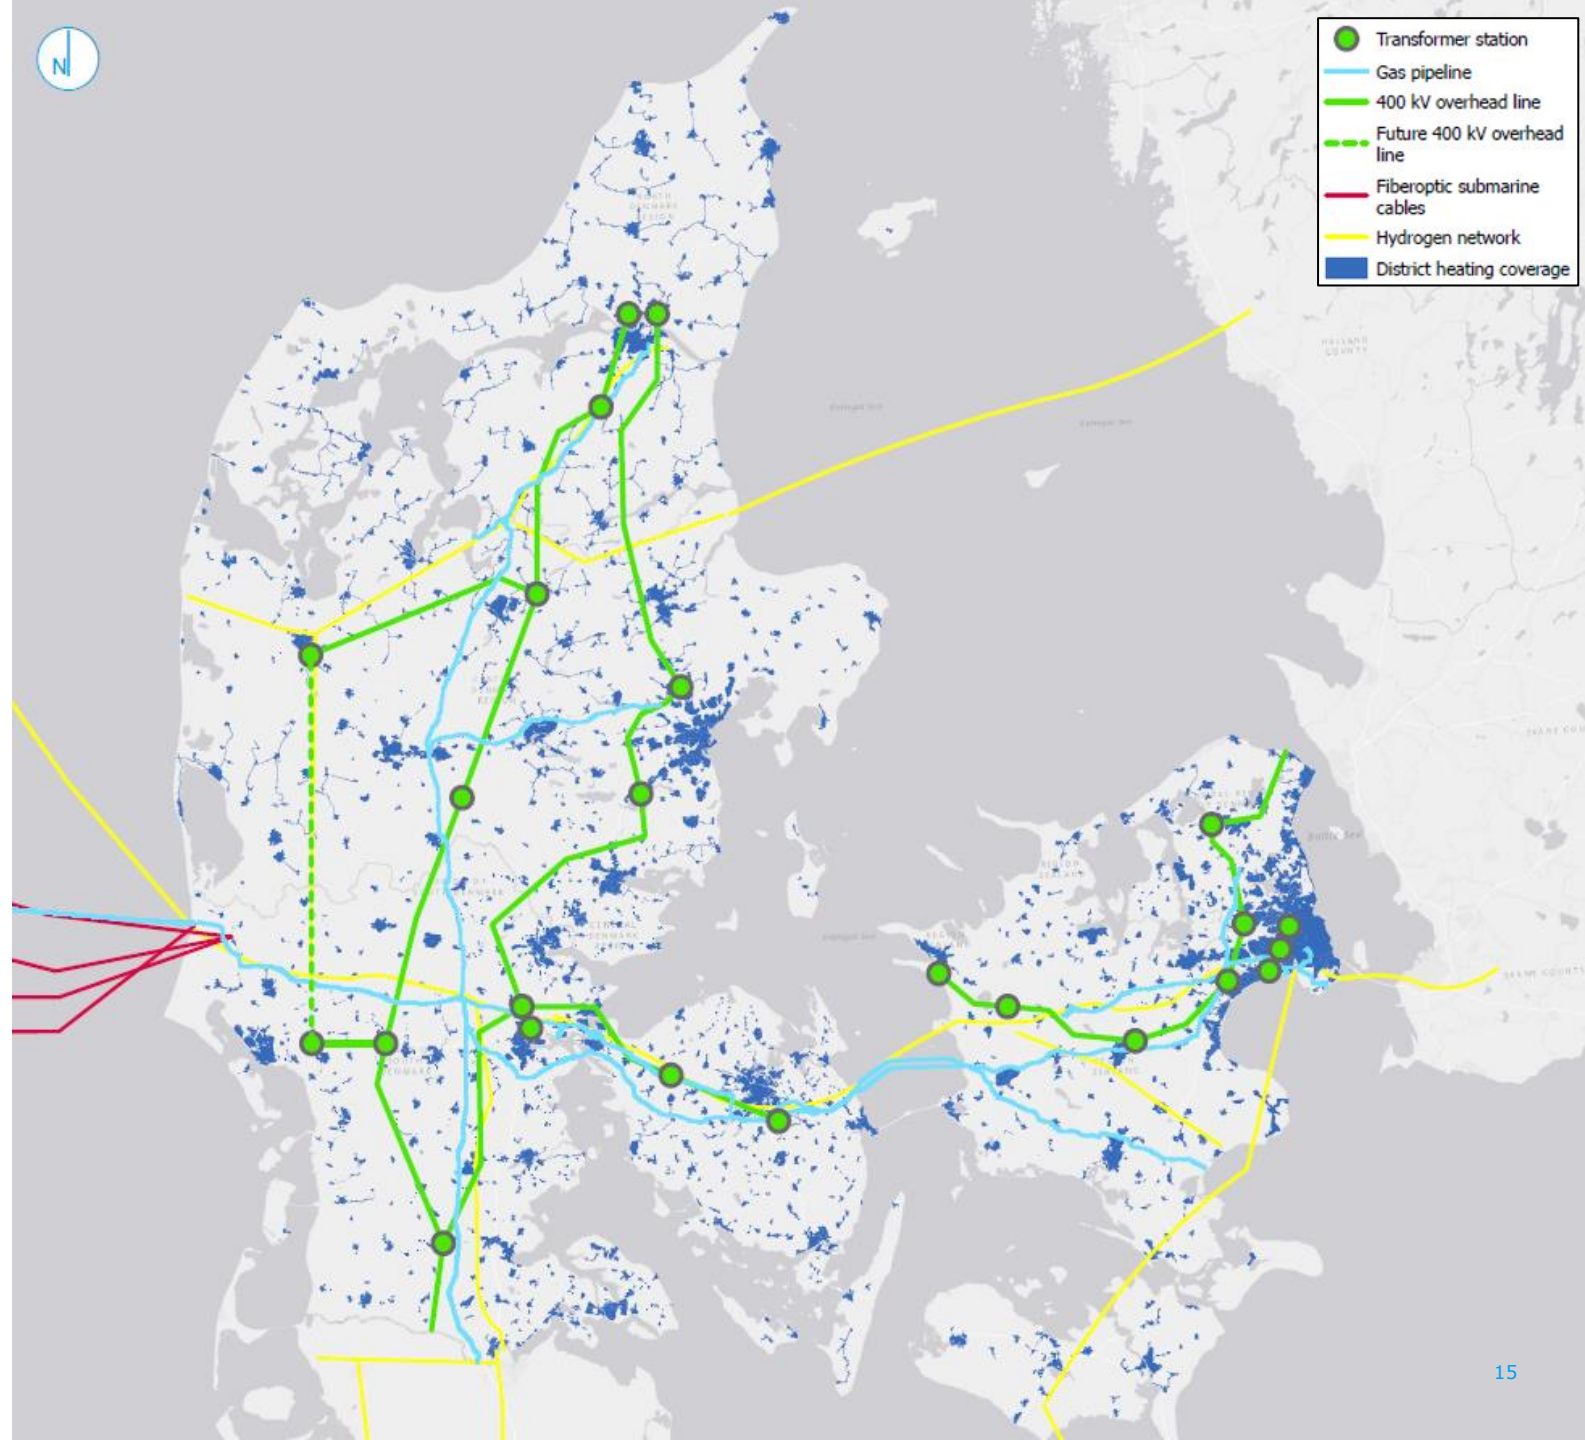

- Denmark's hydrogen network is a key part of the country's green energy transition as it will enable the production, storage and transport of green hydrogen.
- The network will also support the development of new industries, such as e-fuels, and facilitate the integration of renewable energy sources like offshore wind into the energy system.
- The hydrogen network covers most of Denmark and it is connected with export possibilities to Norway, Sweden and Germany.

Power grid

- Denmark has a highly reliable and efficient power grid, where most of the energy supply consists of renewable energy sources.
- Denmark is an energy hub which expects to invest heavily in green energy infrastructure. The result is that there will be an increase in power stations and cables over the coming years.
- Several fiberoptic submarine cables are coming into Denmark from the west, which are ideal for data centres.

District heating coverage

- 66% of Danish households are heated by district heating.
- District heating systems are highly efficient, with efficiencies up to 90%.
- District heating systems significantly reduce greenhouse gas emissions compared to individual heating systems by allowing the use of renewable energy sources.

VARDE IN-DEPTH REVIEW

03

Business region Esbjerg/Varde is a green energy hub

Business region Esbjerg/Varde is globally one of the most **advanced and promising destinations within the green energy transition** and is an integral partner in the World Energy Cities Partnerships.

80% of the offshore wind capacity installed in Europe was shipped from the port of Esbjerg. **In 2022 alone, 23.6 GW of offshore wind** was shipped out from the port. The vast amount of wind energy provides positive spillover effects toward developing the green energy infrastructure in the region.

Denmark was ranked as the **best country in the world to locate a data centre** by Investment Monitor in 2020. And in Denmark, business region Esbjerg/Varde is the most attractive location as the region is the **subsea cable landing hub for the US, UK/IRL and NL.**

The region possess a **highly skilled and experienced workforce within all aspects of the energy sector.** Furthermore, business region Esbjerg/Varde offers **excellent educational opportunities with 60 higher education programs** at six higher educational institutions. These programs include energy technology, engineering and business administration in energy management at university level.

Varde's ambitious climate action plan makes it an attractive destination for investors in green energy-intensive industries

Varde climate ambitions

- Varde has an ambition to help redeem the goals of reducing global greenhouse gas emissions and limiting the global average temperature increase to 1.5°C, aligned with the Paris Agreement.
- Varde aims to reduce greenhouse gas emissions by 70 per cent by 2030 and to be utterly climate-neutral by 2050, which meets the ambitions of the Paris Agreement.
- Varde has set ambitious targets to reduce greenhouse gas emissions in the energy sector by 90% and in the transport sector by 70% by 2030 compared to 1990 levels.
- Varde aims to promote renewable energy production, focusing on solar, wind and biogas plant while improving energy efficiency and infrastructure.
- Varde aims to reduce transport-related CO₂ emissions by enhancing the green fuel infrastructure within the municipality.

Varde's target for reducing greenhouse gas emissions

Varde climate action plan

In October 2022, Varde Municipality received the C40-certification as proof that its climate action plan is ambitious enough to help redeem the goals of reducing global greenhouse gas emissions.

In the energy sector, Varde's climate action plan includes the following:

- **Phasing out all oil and gas boilers:** Varde will phase out all oil and gas boilers and have these replaced with a sustainable heat source by 2030.
- **Fossil fuel-free district heating:** Varde will support the district heating companies in transitioning district heating to become 100 per cent sustainable. Varde further plans to identify new district heating areas that can be connected to the district heating network.
- **Expansion of renewable energy sources:** Varde plans to construct 200 ha solar panels (equal 0.1125 TWh) and 3-4 windmills (equal 0.069 TWh) annually until 2028. Furthermore, it wants to attract PtX companies to store renewable energy.
- **Carbon capture and storage:** Varde aims to develop several Carbon capture and storage projects from waste incineration in collaboration with Energist.
- **Sustainable business growth:** Varde will promote dialogue with companies on energy and resource consumption and improve the green fuel infrastructure. To enable the corporate green transition, Varde has established Green Network Varde.

Varde is at the epicentre of Europe's new economic powerhouse

The North Sea is at the center of European renewable energy

The business region Esbjerg/Varde, located strategically in the North Sea, holds immense potential for renewable energy generation, making it an enticing choice for investors interested in wind power projects. The North Sea region has become increasingly attractive to investors looking to invest in green energy infrastructure, thanks to the significant capacity for wind power that is being auctioned off and scheduled for development in the coming years.

The region has emerged as a thriving hub for the offshore wind industry, playing a vital role in assembling a majority of turbines in Europe's coastal regions. The region has set ambitious goals for itself, aiming to install 150 gigawatts (GW) of offshore wind power by 2050, and this target has recently been increased to 260 GW. Such ambitious goals create a wealth of investment opportunities in offshore wind farms.

What further adds to the appeal of the region is the successful transition it has made from serving the fossil fuel industry to becoming a key player in the wind power sector. This shift positions the region as an attractive location for investors seeking sustainable ventures and aligning their investments with the growing demand for renewable energy sources.

In addition to wind power, the region's attractiveness extends to the data centre industry. The development of a renewable-powered data centre and the laying of cables for international data traffic have further enhanced the region's appeal to investors in this sector. The region's low electricity prices and cold climate also make it cost-effective to store and process data while leveraging outside air for cooling data centres.

The demand for energy storage solutions is also on the rise. Power-to-x facilities that can convert excess wind energy into green hydrogen, ammonia or methanol are in high demand. These liquid e-fuels are essential for facilitating the green energy transition within the transport sector and play a vital role in achieving sustainable and eco-friendly transportation.

Furthermore, the potential of the North Sea region goes beyond energy production alone. Plans for "energy islands" are in the works, which would aggregate electricity from multiple sources and produce hydrogen and facilitate carbon capture and storage (CCS) projects. These ambitious plans present even more investment opportunities and emphasise the region's commitment to advancing green technologies and combating climate change.

In conclusion, business region Esbjerg/Varde's strategic location in the North Sea, its thriving offshore wind industry, the transition to sustainable ventures, the development of renewable-powered data centres, and the overall potential for green energy production make it an attractive choice for investors. The region's commitment to technological advancements, falling costs and innovative energy solutions further enhance its appeal, positioning business region Esbjerg/Varde as a prime investment destination for those seeking opportunities in renewable energy and data centre industries.

Varde has an efficient infrastructure to support the development of the green energy infrastructure

Varde infrastructure

Highways

The highway infrastructure is well connected with Copenhagen (3 hours), Hamburg (3 hours), and the rest of Europe. With a mobile labour force, it will not be an issue to attract qualified labour.

Railways

There is a well-developed railway network in Varde which is connected to the Port of Esbjerg. Hence the municipality is an attractive for companies that wish to align with EU's TEN-T strategy.

Industrial ports

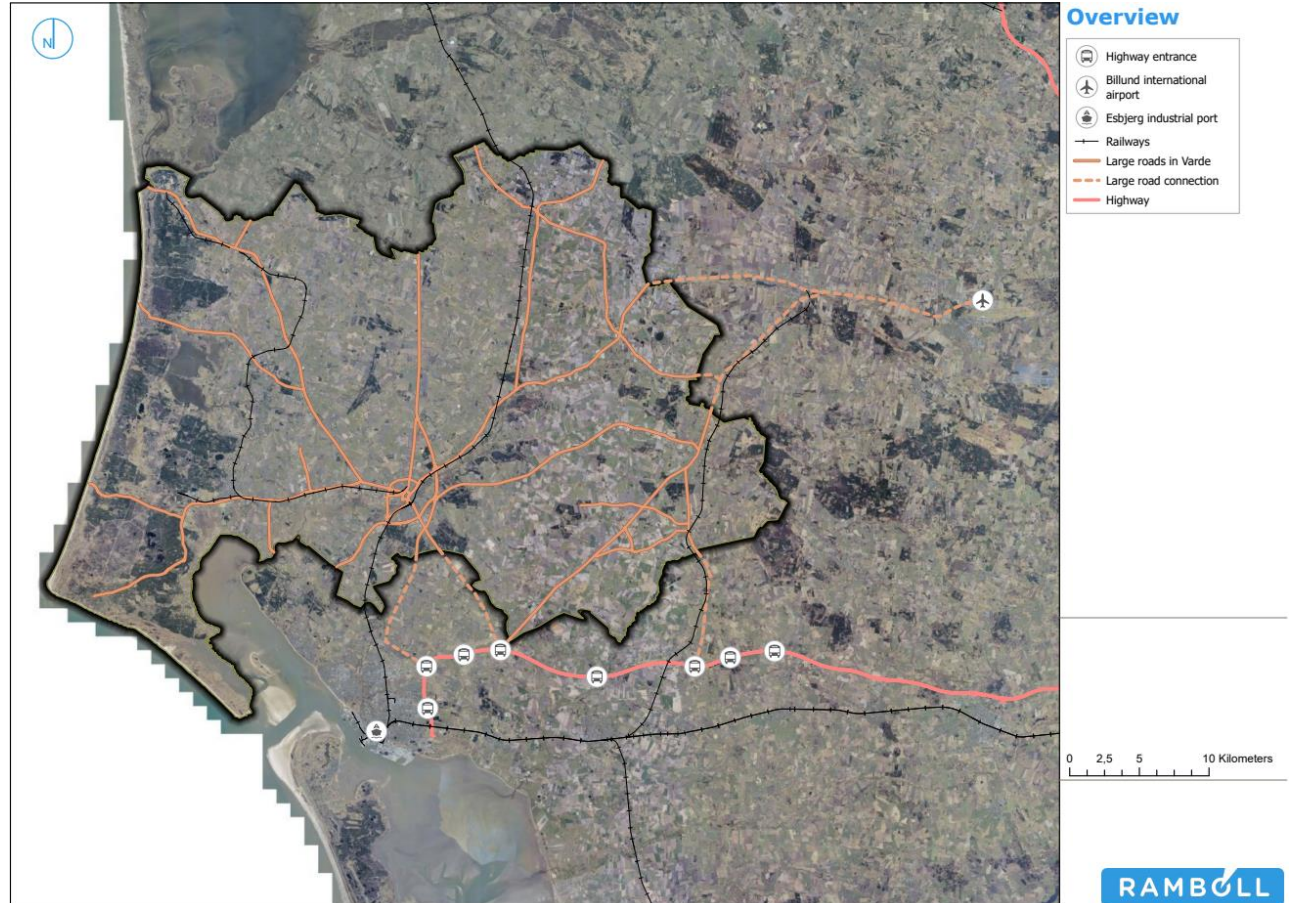

80% of the offshore wind capacity installed in Europe was shipped from the port of Esbjerg. Hence, the port is also fully capable port handle all necessary import and export.

International airports

Billund international airport is only 40 minutes away, why living and working in Southern Denmark means having access to the rest of the world.

Varde possess a best in class utility network to assist the green energy transition

Varde utilities

Varde offers an exceptional utility network and attractive investment opportunities for foreign investors seeking to capitalise on the green energy sector. The Danish Transmission System Operator (TSO), Energinet, has partnered with the business region Esbjerg to drive Denmark's green energy transition. As part of this commitment, Energinet is constructing new transformer stations in Varde, resulting in a resilient power grid with nearby stations that ensure a reliable energy supply.

A key advantage of investing in Varde is the planned hydrogen backbone that will span across the municipality. This infrastructure development positions Varde as an excellent destination for the Power-to-X industry, enabling the large-scale production of green hydrogen and facilitating the growth of innovative energy conversion facilities.

Furthermore, Varde is home to several biogas entities, which provide crucial support to the Power-to-X sector. These entities utilise organic waste for green energy production, contributing to a circular economy and enhancing the sustainability of the region's energy landscape.

Varde's unique advantages extend to the placement of data centres. The municipality serves as the landing hub for subsea connections to the UK, Ireland, and the US, providing an ideal gateway for international data connectivity. Moreover, Denmark's cool climate offers a natural advantage for data centres, as it allows for free air cooling, reducing energy consumption and operational costs.

In addition to its utility infrastructure, Varde boasts an extensive fibre grid, a prerequisite for the establishment of battery factories. This positions the municipality as an attractive destination for investors looking to capitalise on the growing demand for energy storage solutions.

An aerial photograph of a high-voltage power line tower situated in a lush green forest. The tower is a lattice structure, and several power lines extend from it across the scene. The shadows of the tower and lines are cast onto the grassy ground. The overall scene is a mix of green foliage and grey metal structures.

GENERAL SECTOR COUPLING

04

Energy-intensive companies are part of a complex system...

The symbiotic effects and limitations have been taken into account when selecting the site location

Red = Heat
Blue = Cooling
Yellow = CO₂ and gas
Green = Electricity

Ramboll

Several synergies can be utilised through sector coupling energy-intensive industries

Power-to-X (PtX)

Description & Output:

PtX technology converts water into oxygen and green hydrogen through electrolysis via renewable energy. The green hydrogen can either be used directly as a substitute for natural gas, or synthesised into different forms (x) through chemical processes. Common forms are methane, methanol and ammonia. PtX plays an instrumental part in decarbonising the production and consumption of energy.

Synergies:

PtX offers synergies across industries by integrating with district heating networks and providing surplus heat. PtX supplies renewable process heat to industries. PtX serves as energy storage, enabling the use of E-fuels to decarbonise transportation. And PtX can fertilise the agricultural sector through CO₂ free ammonia. These synergies effectively reduce CO₂ emissions and enhance energy efficiency.

Data centres

Description & Output:

A data centre serves as a space for essential IT infrastructure, enabling the creation, operation and delivery of applications and services. It also handles data storage and management. A typical Hyperscale data centre specifically generates substantial computing power, storage capacity and network bandwidth to fulfil the rigorous demands of cloud computing and high-performance applications.

Synergies:

Similar to PtX, data centres also offer synergies across industries, as they provide surplus heat to the district heating network or process heat to various industries. Data centres generally play a positive part in the green energy transition, as they add renewable energy to the energy mix through PPAs setting an example to follow for other industries.

CO₂-heavy industries

Description & Output:

CO₂-heavy industries can take various forms, where the CO₂ differentiates between green and black CO₂ depending on the origin. Green CO₂ originates from point sources burning biomass such as biogas upgrading plants, bio-ethanol plants, biomass power plants and waste-to-energy plants. Black CO₂ originates from point sources burning fossil fuels such as power plants, cement plants, or refineries.

Synergies:

There are strong synergies between CO₂-heavy industries and PtX facilities. PtX is dependent on CO₂ as input in order to store and form the green hydrogen into different E-fuels or gasses. Green CO₂ from biogenic sources is preferable, but the existing power plant at Nybro is an attractive point source for PtX facilities with accessible CO₂ within close proximity.

Battery factories

Description & Output:

A battery factory is a manufacturing facility that produces rechargeable lithium-ion batteries, primarily for electric vehicles. A modern battery has an estimated output of ~17,000 electric vehicles per year for every 1 GWh of production. In addition, the batteries can be used for portable electronics and renewable energy storage systems.

Synergies:

A battery factory generates industrial synergies that contributes to the renewable energy systems. The production of batteries generates green surplus heat, given that the battery factory is powered by green electricity, that can be used in the district heating network. Battery factories can also utilise surplus heat and regenerate water back to other resources

Greenhouse farming

Description & Output:

Greenhouse farming cultivates crops in controlled structures, allowing farmers to regulate temperature, humidity and sunlight. It can produce various products like vegetables, fruits, plants and flowers. As the world's population increases, greenhouse farming will become instrumental for global food production.

Synergies:

Greenhouses provide an excellent solution for utilising the surplus heat generated by energy-intensive industries. Moreover, PtX facilities and greenhouses have synergistic benefits, as the ammonia produced by PtX can be conveniently used as fertiliser without requiring extensive transportation.

Sector coupling the energy-intensive industries provides Varde with a unique surplus heat infrastructure

Sector coupling, directly integrating energy-intensive industries with green energy sources, offers a remarkably climate-friendly solution for heating municipalities. In Varde, there will be abundant green energy and energy-intensive industries. This unique combination enables Varde to harness the surplus heat generated by green energy.

**INDIVIDUAL SITE
SELECTION & SECTOR
COUPLING**

05

Overview of selected sites

Sector coupling of selected sites

The symbiotic effects between the various energy-intensive industries have been carefully considered when identifying the site locations. The chart to the right shows all the identified site locations for the respective industry types. Below are some key considerations highlighted for determining the site locations for the various industries.

PtX:

The sites are ideally located close to the H₂ and CO₂ backbone. They should further be located close to the district heating network to utilise the generate surplus heat. And lastly, they should also be near a transformer station and water plant.

Data Centres:

The sites must be located near the fibre grid. Similar to PtX, data centres should also be located near the district heating network and transformer stations.

CO₂-heavy industries:

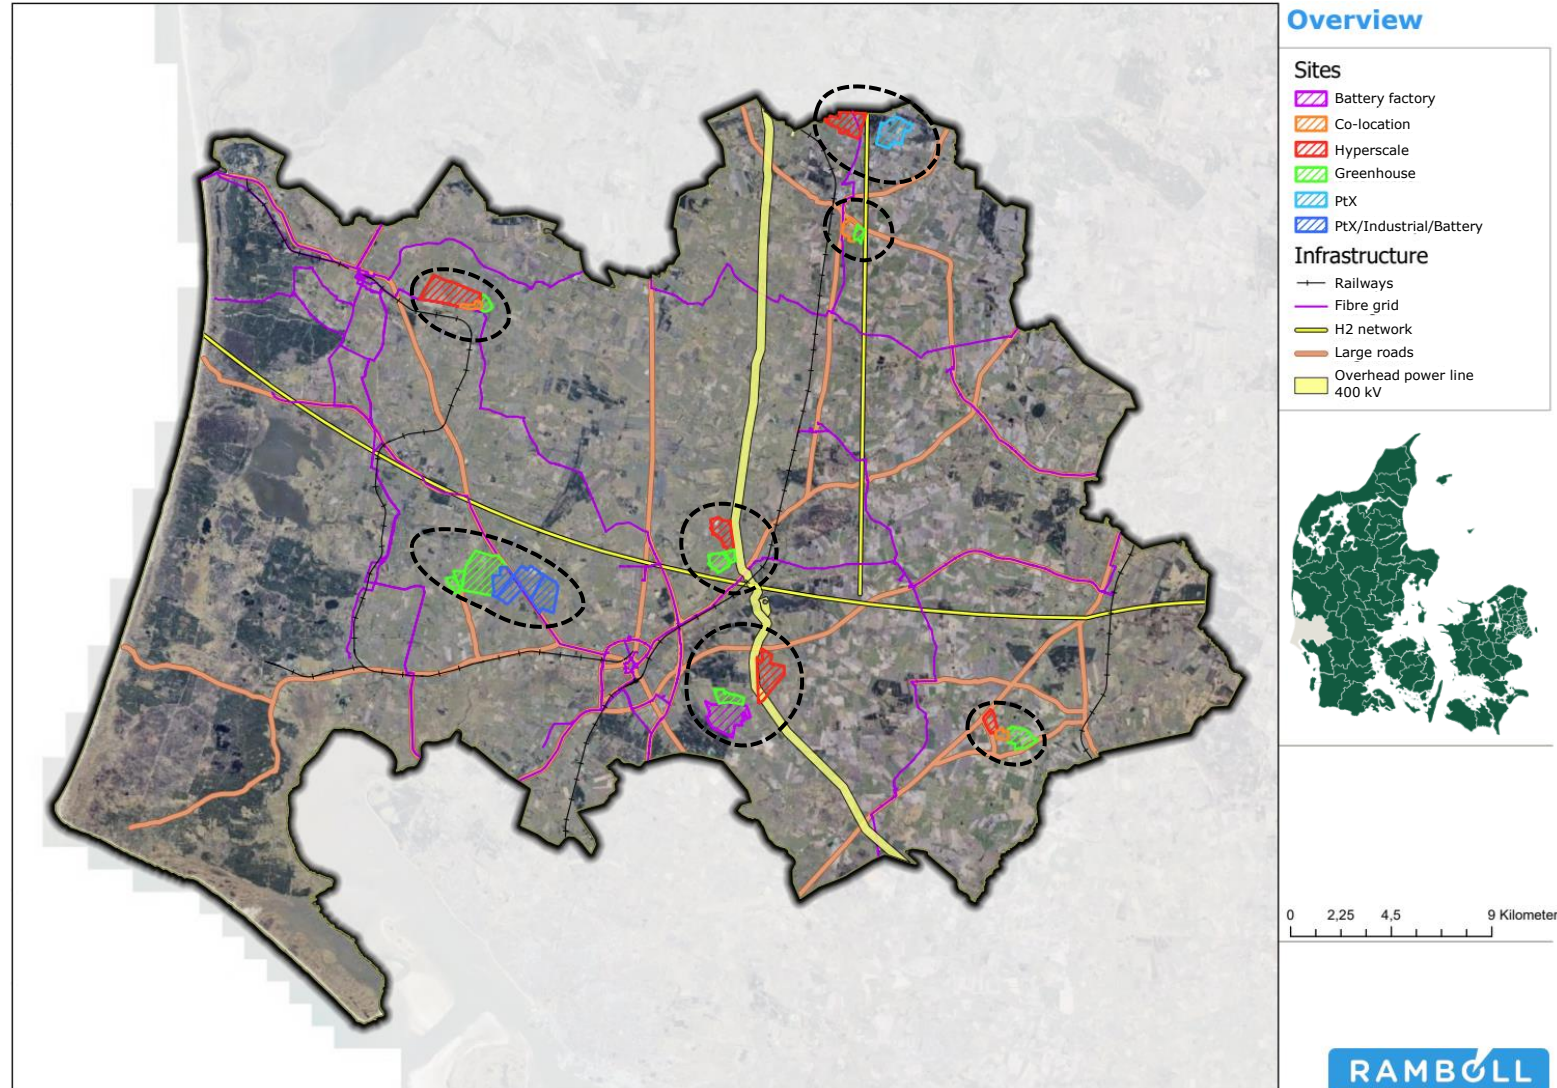

There are strong synergies between CO₂-heavy industries and PtX facilities, which is why these should preferably be closely located. Furthermore, there are excellent CCS possibilities near Nybro due to the "Bifrost" project.

Battery factories:

The sites must be located close to the district heating network. The sites require an efficient surrounding infrastructure. And they should have access to green energy.

Greenhouses:

The sites should be located close to sites generating surplus heat. They must be located near the district heating network and have access to renewable energy.

Overview of 22 ha Greenhouse, Lindbjergvej 1

Site summary

Utilities:

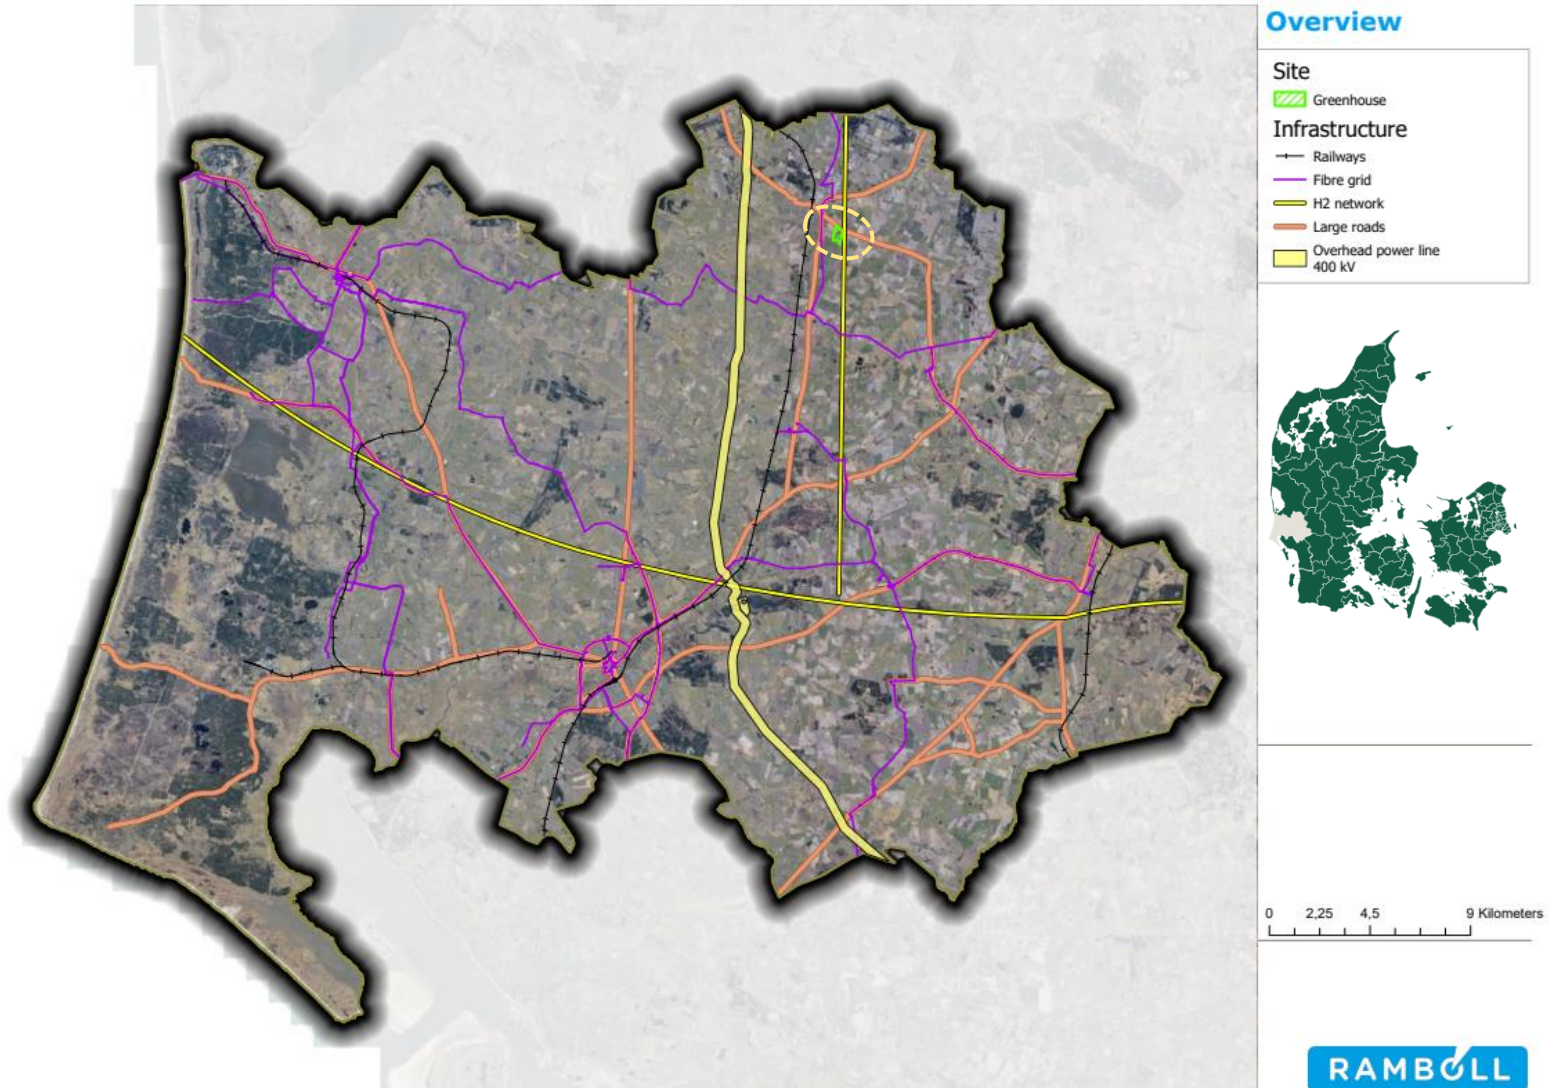

The site's strategic location near a Co-location data centre presents an advantageous opportunity for harnessing surplus heat. By being an off-taker of this heat, the chosen site exemplifies the concept of sector coupling. The greenhouse facility can efficiently utilise renewable surplus heat at an affordable price while also extending support to other industries seeking to discard their surplus heat. The surrounding area provides an excellent utility network, but it will not be possible to connect to the collective electrical grid before 2027.

Protected areas:

Greenhouses possess a non-disruptive nature, enabling their placement near protected areas. This presents an opportunity for constructing a large-scale greenhouse that coexists harmoniously with the protected areas. The chosen site does not overlap with any protective areas, why it should be easy to obtain the needed permits. A minor attention point is a preserved historic site in the western part of the site, which will require an additional cost to build on top of.

Land ownership and suburban areas:

The identified site is owned by seven different landowners, featuring three properties. And the site benefits from excellent transport facilities with a large road right next to the site.

Utilities

Positive attributes

- The site is located strategically near a hyperscale data centre that will generate an abundance of surplus heat.
- As an off-taker of heat, the following site location is a strong example of sector coupling. The greenhouse can utilise the renewable surplus heat acquired at an affordable price and also support other industries adopting their process heat.
- New transformer stations are planned to be built in this area, as a nearby location is also expected to host PtX facilities.
- There are plans to construct a new renewable energy plant that can power the data centre with renewable energy.

Additional attention points

- It will not be possible to connect the collective electrical grid before 2027, as this is when Energinet expects to finalise the TSO infrastructure surrounding the town Ølgod.

Protected areas

Positive attributes

- Greenhouses have the advantage of being relatively non-disruptive to their surroundings, allowing them to be situated near protected areas without causing significant harm. This characteristic opens up opportunities for locating greenhouses in close proximity to these protected areas.
- In the case of the identified site, all of the site falls outside the borders of protected areas. This presents a favourable situation for the construction of a large-scale greenhouse, as it can take advantage of the available space without conflicting with conservation efforts.

Additional attention points

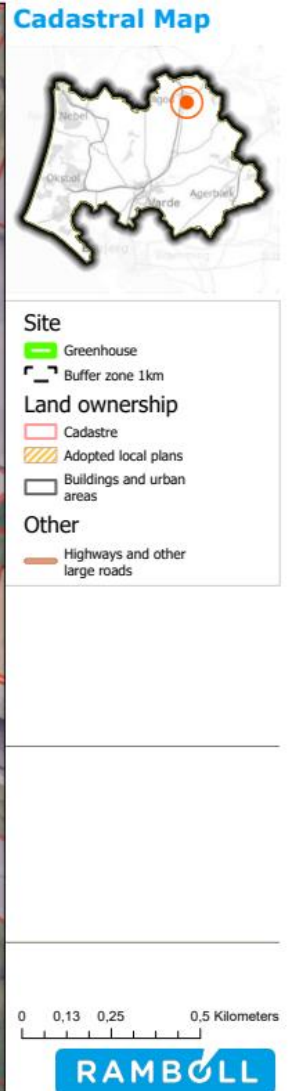

- In the western part of the site, there is a preserved historic site, which will require an additional cost to build on top of.

Land ownership and suburban areas

Positive attributes

- The identified site is owned by six different landowners, and there are three properties on the site. Hence, only minor transaction costs can be expected to acquire the site.
- The transport facilities are excellent, with a large road right next to the site.
